1. Data-Quality & Scope Note

This section is included deliberately, at the front of the report, because the original report brief supplied for this project was written for a different kind of project.

The brief requested a “Business Performance 360° Dashboard” report — built around an Excel dataset and a Power BI dashboard — covering revenue, profit, orders, customers, products, categories, and regions, with KPIs such as Total Revenue, Total Profit, Total Orders, Total Customers, and Profit Margin. None of those fields exist in the dataset actually supplied for this project.

The dataset actually supplied and analyzed here is a Python (Pandas / NumPy / Matplotlib / Seaborn) exploratory data analysis of 100 recently funded Indian startups — a funding-announcement dataset with startup name, website, industry tags, country, funding amount, funding type (stage), and last funding date. There is no revenue, profit, order, or customer information in this dataset, and no Power BI dashboard was built or supplied — all analysis and all 12 charts referenced in this report were produced directly in the accompanying Jupyter notebook using Pandas, Matplotlib, and Seaborn.

Rather than force-fitting the mismatched template onto data it cannot describe, this report has been restructured around what the dataset actually supports: funding size, funding stage (Pre-Seed through Private Equity), industry composition, monthly funding trends, and deal concentration. Every figure, table, and chart in the sections that follow is taken directly from the analysis notebook's own printed output or from the twelve chart images it generated — nothing has been estimated or invented to fit the original brief's revenue/profit framing.

Two additional data-quality points are worth flagging up front, and are revisited with full detail in Section 16 (Key Business Insights):

- 13 of the 100 records (13%) have no disclosed funding amount, including 2 of the 7 Private Equity deals — so all totals in this report should be read as a floor, not a ceiling.
- 96% of startups carry two or more industry tags (up to 7 for a few records), so industry-level counts and funding totals overlap across categories rather than forming mutually exclusive segments.

2. Executive Summary

This report analyzes 100 recently funded Indian startups, covering a two-month window of disclosed funding activity (January–February 2026), with a combined disclosed funding value of \$1,315,987,751 across 87 records that report an amount (a 87% disclosure rate).

The purpose of the analysis is to understand how capital is currently distributed across funding stages, industries, and time — not to evaluate the financial performance of any single company, but to characterize the shape of the funding market itself: who is raising, how much, at what stage, in which sectors, and how concentrated that capital is.

Overall Funding Landscape

The market shows a classic early-stage-heavy, capital-light-at-the-bottom pattern. Seed is the most common funding stage by far (44 of 100 deals) but accounts for only 6.3% of total disclosed capital. At the other end, Private Equity deals — just 7 of 100 — account for 53.6% of all disclosed funding, driven by a small number of very large rounds in housing finance and clean energy.

Most Important Findings

- Funding is highly concentrated: the 10 largest deals alone represent 70.95% of total disclosed funding.
- Average funding per startup (\$15.1M) is roughly 5× the median (\$3.0M), confirming the distribution is driven by a small number of large deals rather than being broadly representative of a “typical” round.
- Finance (\$475.3M) and Energy (\$390.9M) are the two highest-funded industry tags, even though neither is the most frequently occurring tag — that distinction belongs to Consumer Goods and E-commerce (24 startups each).
- Month-over-month, both the number of funded startups (31 → 69) and total funding (\$214.1M → \$1,101.9M) rose sharply between January and February, with average deal size also increasing — indicating the rise was driven by larger rounds, not only by more startups being funded.
- A single company, Aditya Birla Housing Finance (\$304.5M, Private Equity), accounts for roughly 23% of all disclosed funding in the dataset on its own.

Major Opportunities

The heavy concentration of capital in a handful of large, late-stage deals suggests that ecosystem-level funding totals should not be read as a signal of broad-based early-stage strength. The large volume of Seed and Pre-Seed activity (56 of 100 deals) represents the pipeline that growth-stage capital will eventually need to draw from, and tracking how many of these companies progress to larger rounds over subsequent periods would be a valuable extension of this analysis.

Key Business Recommendations

- Report deal count and capital volume as two separate leaderboards, since they tell very different stories about which stages and sectors are “hot”.
- Treat this period's aggregate totals as a lower bound given the 13% disclosure gap, and prioritize following up on the two undisclosed Private Equity amounts specifically.
- Always disclose the largest individual deal separately when discussing sector or period totals, since single companies (e.g., Aditya Birla Housing Finance) can dominate an entire sector's reported total.

3. Business Problem

Startup investors, ecosystem analysts, and founders benchmarking their own fundraise all face the same underlying problem: funding-announcement data is scattered, inconsistently reported, and easy to misread in aggregate. A headline like “\$1.3 billion raised by Indian startups this period” says very little on its own — it could reflect broad-based early-stage momentum, or it could be almost entirely explained by one or two very large late-stage rounds.

This analysis addresses that problem directly by breaking down the funding total along the dimensions that matter for interpretation: funding stage (how mature are the companies raising), industry (which sectors are attracting capital, and does that differ between deal count and deal value), and time (is activity accelerating, and is that acceleration driven by more deals or bigger ones).

A clear view of these breakdowns helps stakeholders:

- Monitor how many startups are being funded at each stage, and how that compares to the capital each stage actually receives.
- Track which industries are attracting the most capital versus which are simply the most frequently tagged.
- Identify unusually large individual deals that may be distorting sector- or period-level totals.
- Assess month-over-month funding momentum without being misled by a single large round.
- Make data-driven observations about where the funded-startup pipeline is concentrated, and where it is thin.

4. Project Objectives

The objectives of this analysis are:

- Profile the overall shape of the funding dataset — volume, coverage, and time span.
- Calculate and interpret core funding KPIs (total, average, median, largest funding, and disclosure coverage).
- Analyze the distribution of funding amounts, including skew and statistical outliers.
- Identify the startups that raised the largest individual rounds.
- Break down funding by stage (Pre-Seed through Private Equity), both by deal count and by capital raised.
- Break down funding by industry, accounting for the fact that startups can carry multiple industry tags.
- Cross-tabulate industry against funding stage to see where specific sectors sit in the funding lifecycle.
- Track funding and startup-count trends across the two-month reporting window.
- Quantify how concentrated total funding is among the largest deals.
- Translate every statistical finding into a business insight with a clear recommended action.

5. Dataset Overview

The dataset (Recently_Funded_Startups_In_India_2026.csv) contains 100 records and 7 original columns, each row representing one startup's most recent disclosed funding event.

Column	Description
Name	Startup name
Website	Startup's website domain
Industry	Comma-separated list of industry tags (1–7 tags per startup)
Country	Country of registration — India for all 100 records
Funding Amount (USD)	Disclosed funding amount; stored as text with \$ and commas, 13% missing
Funding Type	Funding stage — 10 distinct stages from Pre-Seed to Private Equity
Last Funding Date	Date of the most recent funding round — spans January–February 2026

Table 1 — Original dataset columns

Coverage at a Glance

Metric	Value
Total records / unique startups	100
Unique raw industry-tag combinations	92
Unique funding stages	10
Countries represented	1 (India)
Records with a disclosed funding amount	87 (87%)
Records missing a funding amount	13 (13%)
Date range covered	1 Jan 2026 – 1 Feb 2026

Table 2 — Dataset profile

This is a single-country, single-currency dataset with no duplicate records and no duplicate startup names, which makes it well-suited to funding-stage and industry-level aggregation without needing cross-currency or cross-market normalization.

6. Data Preparation & Cleaning

The raw dataset required several cleaning steps before it could support reliable analysis, all performed in the accompanying Pandas notebook:

- Column names were standardized to lowercase, underscore-separated form (e.g., “Funding Amount (USD)” → `funding_amount_usd`).
- Text fields (name, industry, `funding_type`) were stripped of leading/trailing whitespace and cast to a consistent string type.
- Funding Amount was parsed from formatted text (e.g., “\$9,803,025”) into a numeric float column, with dollar signs and thousands separators stripped, and placeholder values such as “N/A”, “-”, or blank treated as missing rather than zero.
- Last Funding Date was parsed into a proper datetime type using a mixed-format parser, with invalid dates coerced to missing (none were found — 0 invalid/missing dates).
- Derived date attributes — funding year, month, month name, and quarter — were generated from the cleaned date field to support the monthly and quarterly trend analysis in Section 13.
- An `industry_count` field was derived by splitting the comma-separated industry tag list, used throughout the report to flag and account for multi-industry startups.
- A missing-value and duplicate-record audit confirmed 0 duplicate rows, 0 duplicate startup names, and quantified missing data precisely to the Funding Amount field (13 of 100 records, 13.0%) — every other field is 100% complete.

No records were dropped during cleaning. Rows with a missing funding amount are retained throughout the report for stage-count and industry-count purposes, but are correctly excluded from sum/average/median funding calculations by Pandas’ default null-handling — this is why, for example, Private Equity shows 7 startups by count but funding statistics computed from only 5 of them (see Section 16, Insight 8).

7. Key Performance Indicators

The table below summarizes the core funding KPIs computed across all 100 startups in the dataset.

KPI	Value	What it measures / why it matters
Total Startups	100	Size of the funded-startup cohort analyzed
Total Disclosed Funding	\$1,315,987,751	Combined capital raised across all disclosed rounds
Average Funding per Startup	\$15,126,296	Mean round size — pulled upward by large outlier deals
Median Funding per Startup	\$3,000,000	Typical round size — a more representative “typical deal” figure
Largest Single Round	\$304,527,929	Aditya Birla Housing Finance (Private Equity)
Funding Disclosure Coverage	87.00%	Share of records reporting a usable funding amount
Unique Funding Stages	10	Breadth of the funding lifecycle represented, Pre-Seed to Private Equity

Table 3 — Key Performance Indicators

The single most important relationship in this KPI set is the gap between the average (\$15.1M) and the median (\$3.0M): the average is more than five times the median, which is the clearest quantitative signal that this dataset's funding total is shaped by a small number of very large deals rather than representing what a typical funded startup raised. This is explored in full in Sections 8, 14, and 16.

8. Funding Distribution Analysis

The histogram below plots the distribution of individual funding amounts across all 87 startups with a disclosed value. The distribution is strongly right-skewed: the large majority of deals cluster under \$10M, with a long tail of progressively rarer, much larger deals extending out to \$304.5M.

Chart 1 — Distribution of Startup Funding Amounts

Statistic	Value
Count (disclosed)	87
Mean	\$15,126,296
Std. deviation	\$40,492,650
Minimum	\$82,941
25th percentile	\$1,000,000
Median (50th percentile)	\$3,000,000
75th percentile	\$9,901,513
Maximum	\$304,527,929

Table 4 — Funding amount summary statistics

The standard deviation (\$40.5M) is more than double the mean itself, which is a strong numerical signal of a heavy-tailed distribution driven by a handful of very large deals rather than a bell-shaped spread around a central value. Half of all disclosed deals fall between \$1.0M and \$9.9M (the interquartile range), while the top quarter of deals extends all the way to \$304.5M.

9. Top 10 Startups by Funding

The ten largest disclosed funding rounds in the dataset are listed below. Four of the top five — and all four of the top four — are Private Equity rounds in capital-intensive housing-finance and clean-energy businesses, illustrating how late-stage, infrastructure-adjacent deals dominate the top of the funding table.

#	Startup	Industry Tags	Funding Type	Amount
1	Aditya Birla Housing Finance	Finance, Real Estate	Private Equity	\$304,527,929
2	CleanMax	Energy, Environment	Private Equity	\$165,434,178
3	GREW Solar	Energy, Electronics, Hardware, Manufacturing	Private Equity	\$115,738,738
4	Radiance Renewables	Energy, Construction, Environment, Utilities	Private Equity	\$100,000,000
5	Arya Collateral	Agriculture, Finance, Logistics, Marketplace	Series D	\$80,584,611
6	The Whole Truth	Food & Beverage, Wellness, Consumer Goods, E-commerce, Nutrition & Supplements	Series D	\$51,000,000
7	JS AutoCast	Manufacturing, Automotive, Materials, Mechanical Engineering	Venture – Series Unknown	\$32,773,634
8	Supertails	Pets, E-commerce, Healthcare, Retail	Series C	\$30,000,000
9	Easy Home Finance	FinTech, Finance, Real Estate	Series C	\$30,000,000
10	Knight FinTech	FinTech, Finance, B2B Software	Series A	\$23,600,000

Table 5 — Top 10 startups by disclosed funding amount

Chart 2 — Top 10 Indian Startups by Funding

These 10 startups alone account for \$933.7M — 70.95% of all disclosed funding in the dataset (see Section 15). Their industry mix also reinforces the pattern seen in Section 11: Finance and Energy tags dominate the very largest rounds, even though they are far from the most frequently occurring tags overall.

10. Funding by Stage Analysis

Funding stage is the single most explanatory dimension in this dataset. The table and charts below break down both how many startups sit at each stage and how much capital each stage actually captured.

Funding Stage	Startups	Total Funding	Avg. Funding	Median Funding
Private Equity	7	\$705,091,478	\$141,018,296	\$115,738,738
Series A	16	\$169,259,850	\$11,283,991	\$8,823,156
Series D	3	\$141,584,611	\$47,194,870	\$51,000,000
Series C	4	\$86,144,311	\$21,536,078	\$26,414,959
Seed	44	\$82,884,549	\$2,125,245	\$1,985,210
Series B	6	\$59,751,837	\$11,950,373	\$9,803,025
Venture – Series Unknown	6	\$43,321,240	\$8,664,248	\$2,600,000
Series E	1	\$21,918,324	\$21,918,324	\$21,918,324
Pre-Seed	12	\$4,941,551	\$549,061	\$221,366
Convertible Note	1	\$1,090,000	\$1,090,000	\$1,090,000

Table 6 — Funding by stage (sorted by total funding)

Chart 3 — Total Funding by Funding Stage

Chart 4 — Number of Startups by Funding Stage

Chart 5 — Distribution of Startups by Funding Stage

Two patterns stand out immediately. First, Seed is by far the most common stage (44 of 100 startups, 44%) but ranks fifth by total capital raised — its combined \$82.9M is smaller than the total for Series A, Series C, and Series D individually. Second, Private Equity — just 7 startups, 7% of the dataset — raised more capital (\$705.1M) than every other stage combined (\$610.9M). This single-stage dominance is examined in full in Section 16, Insight 1.

11. Industry Analysis

Because most startups in this dataset carry multiple industry tags (see Section 1), industry figures below are computed by exploding each startup's tag list, so a single funding round contributes to the count and total of every industry it is tagged with. This is necessary to see thematic patterns, but it means industry totals are not mutually exclusive — see Insight 9 in Section 16 for the implications.

Most Frequently Tagged Industries

Industry	Startups Tagged
Consumer Goods	24
E-commerce	24
B2B Software	23

Industry	Startups Tagged
Retail	19
Hardware	18
Manufacturing	17
Finance	16
Wellness	15
Artificial Intelligence	14
Healthcare	13
Food and Beverage	12
FinTech	9
Marketplace	8
Electronics	8
Energy	7

Table 7 — Top 15 industries by number of startups tagged

Chart 6 — Top Industries by Number of Startups

Highest-Funded Industries

Industry	Startups	Total Funding	Share of Total
Finance	16	\$475,263,666	11.6%
Energy	7	\$390,943,369	9.5%
Real Estate	4	\$340,829,299	8.3%
Environment	6	\$289,434,178	7.1%
Manufacturing	17	\$217,755,318	5.3%
Hardware	18	\$152,690,371	3.7%
E-commerce	24	\$151,408,165	3.7%
Electronics	8	\$135,987,987	3.3%
Marketplace	8	\$129,267,701	3.2%
Agriculture	4	\$117,584,611	2.9%
Consumer Goods	24	\$114,207,944	2.8%
B2B Software	23	\$108,905,411	2.7%
Construction	2	\$100,221,366	2.4%
Healthcare	13	\$100,009,794	2.4%
Utilities	1	\$100,000,000	2.4%

Table 8 — Top 15 industries by total disclosed

Chart 7 — Top Industries by Total Funding

Chart 8 — Funding Share of Top Industries

The two rankings diverge sharply. Consumer Goods and E-commerce are tagged on the most startups (24 each) but rank 11th and 7th respectively by funding — together they represent under 6.5% of total capital despite representing nearly half of all startups by tag frequency. Finance and Energy, by contrast, are tagged on far fewer startups (16 and 7) but capture the two largest funding shares (11.6% and 9.5%). This is the clearest evidence in the dataset that industry “popularity” (deal count) and industry “attractiveness to capital” (funding total) are two different rankings that should not be conflated — see Insight 4.

12. Industry × Funding Stage

The heatmap below cross-tabulates the ten most common industry-tag combinations against funding stage, showing exactly where specific sector groupings sit in the funding lifecycle. Darker cells indicate more startups in that combination-and-stage pair.

Chart 9 — Top Industries × Funding Stage (cross-tabulation)

Several sector combinations show a clear stage concentration: the “Pets, Consumer Goods, E-commerce, Food and Beverage, Retail” combination is concentrated entirely at Seed (2 of 2 startups), while “Healthcare, Artificial Intelligence, B2B Software, Biotechnology, Data” sits entirely at Series B. “FinTech, Finance, B2B Software” and plain “Healthcare” both split between Pre-Seed/Seed and Series A, suggesting these sectors have startups at multiple points along the funding lifecycle rather than clustering at one stage. This granular view is a useful complement to the stage-level and industry-level totals in Sections 10 and 11, since it shows where specific sector niches — not just broad industry tags — are concentrated.

13. Monthly Funding Trend Analysis

The dataset spans exactly two calendar months — January and February 2026 — so trend analysis here is necessarily a two-point comparison rather than a long-run series. Both months show growth, and importantly the growth is not explained by volume alone.

Month	Startups Funded	Total Funding	Average Funding
January 2026	31	\$214,102,218	\$7,136,741
February 2026	69	\$1,101,885,533	\$19,331,330

Table 9 — Monthly funding summary

Chart 10 — Monthly Startup Funding Trend

Chart 11 — Monthly Number of Funded Startups

From January to February, the number of funded startups rose 123% (31 → 69) while total funding rose 415% (from \$214.1M to \$1,101.9M). Because the percentage increase in capital is far larger than the percentage increase in deal count, the average deal size itself grew substantially — from \$7.1M in January to \$19.3M in February, a 2.7× increase. In other words, February was not simply “more of January”; it included a shift toward larger individual rounds. This is examined further, with the specific large deals responsible, in Insight 7 of Section 16.

Because the observation window is only two months, this should be read as a snapshot of momentum rather than a confirmed seasonal or long-run trend; the quarterly roll-up (Q1 2020: 100 startups, \$1,315,987,751) simply restates the full-period total, since both months fall in the same quarter.

14. Large Deals & Outlier Analysis

A standard IQR (interquartile range) test was applied to the funding amount field to identify statistically unusual deals. Using $Q1 = \$1,000,000$ and $Q3 = \$9,901,513$ ($IQR = \$8,901,513$), the outlier bounds are:

Bound	Value
Lower bound	-\$12,352,269 (not applicable — funding cannot be negative)
Upper bound	\$23,253,781

Table 10 — IQR outlier bounds

Chart 12 — Funding Amount Distribution and Outliers (box plot)

Exactly 10 deals exceed the \$23.25M upper bound and are flagged as statistical outliers — the same 10 startups identified in Table 5 as the top 10 by funding. This confirms that the “large deal” threshold in this dataset is quite low relative to the size of the very largest rounds: a single deal at or above roughly \$23M is already unusual by this dataset's own statistical profile, yet the largest deal (\$304.5M) is more than 13× that threshold.

Startup	Funding Type	Amount
Aditya Birla Housing Finance	Private Equity	\$304,527,929
CleanMax	Private Equity	\$165,434,178
GREW Solar	Private Equity	\$115,738,738
Radiance Renewables	Private Equity	\$100,000,000
Arya Collateral	Series D	\$80,584,611
The Whole Truth	Series D	\$51,000,000
JS AutoCast	Venture – Series Unknown	\$32,773,634
Easy Home Finance	Series C	\$30,000,000
Supertails	Series C	\$30,000,000
Knight FinTech	Series A	\$23,600,000

Table 11 — All 10 statistical outliers (funding amount)

15. Funding Concentration Analysis

Combining the findings from Sections 9, 10, and 14, this section states the concentration finding directly: the 10 largest deals in the dataset together account for \$933,659,090 of the \$1,315,987,751 total — 70.95% of all disclosed funding — while representing just 10% of the 100 startups in the dataset.

Segment	Share of Startups	Share of Funding
Top 10 startups	10%	70.95%
Remaining 90 startups	90%	29.05%
Private Equity stage alone	7%	53.58%
Seed stage alone	44%	6.30%

Table 12 — Funding concentration by segment

This level of concentration is a defining characteristic of the dataset and should govern how every other figure in this report is interpreted: aggregate totals, industry rankings, and month-over-month growth figures are all substantially influenced by a small number of very large Private Equity rounds, most visibly Aditya Birla Housing Finance's single \$304.5M raise, which alone represents 23.1% of total disclosed funding across all 100 startups.

16. Key Business Insights

The ten insights below translate the statistical findings from Sections 7–15 into concrete business interpretations, grounded strictly in the numbers produced by the analysis notebook. Each insight states the finding, why it matters, and a specific recommended action.

Insight 1: Private Equity deals are only 7% of transactions but 53.6% of capital

Finding: Private Equity accounts for 7 of 100 deals (7%) yet \$705,091,478 of total disclosed funding (53.6%). The average Private Equity round (\$141.0M) is roughly 66× the average Seed round (\$2.1M).

Business Impact: Aggregate “total funding” headlines for this period are overwhelmingly a story about a handful of large, late-stage infrastructure and finance deals, not a signal of broad-based early-stage momentum across the ecosystem.

Recommended Action: Always report deal count and capital volume as two separate metrics. Anyone using “total funding raised” as a proxy for how many companies are being funded, or for early-stage market health, should be redirected to the stage-level breakdown in Section 10.

Insight 2: Seed is the highest-volume stage but the lowest-capital stage per deal

Finding: Seed is the most frequent funding stage (44 of 100 deals, 44%) but captures only \$82,884,549 — 6.3% of total funding. Its median deal size (\$1,985,210) is roughly 58× smaller than the Private Equity median (\$115,738,738).

Business Impact: The funding pipeline is bottom-heavy in deal count but top-heavy in capital — a large cohort of early-stage companies is being seeded, but only a small fraction of total capital is allocated to helping that cohort get started, consistent with a market where the real capital gate is later-stage growth funding.

Recommended Action: Track this cohort of 44 seed-stage companies over subsequent reporting periods to measure what share progress to Series A and beyond — that conversion rate is a more meaningful early-stage health metric than the seed funding total alone.

Insight 3: The top 10 deals account for 70.95% of all disclosed funding

Finding: The ten largest individual rounds sum to \$933,659,090 out of \$1,315,987,751 total — 70.95% of all disclosed capital, concentrated in just 10% of the startups analyzed.

Business Impact: Extreme concentration means period-over-period funding totals can swing dramatically based on whether one or two large deals happen to close within the reporting window, independent of any underlying change in the broader ecosystem.

Recommended Action: When comparing this period's total funding to a prior period, always check whether the comparison is driven by the presence or absence of a handful of large deals before attributing the change to a broader market trend.

Insight 4: Finance and Energy dominate capital despite modest deal counts

Finding: Finance (16 startups, \$475,263,666, 11.6% of total funding) and Energy (7 startups, \$390,943,369, 9.5%) are the two highest-funded industry tags, even though Consumer Goods and E-commerce are each tagged on more startups (24 each) but rank far lower in total funding (2.8% and 3.7% respectively).

Business Impact: Capital-intensive sectors — clean-energy infrastructure (CleanMax, GREW Solar, Radiance Renewables) and housing/real-estate finance (Aditya Birla Housing Finance) — pull in disproportionately large rounds relative to their deal frequency, while high-frequency consumer and software tags attract many smaller deals.

Recommended Action: Present industry rankings as two distinct lists — “most active sectors by deal count” and “most capital-intensive sectors by funding” — rather than a single ranking, since conflating the two misrepresents which sectors are actually absorbing the most capital.

Insight 5: Average funding is 5× the median, confirming a heavily skewed distribution

Finding: Average funding per startup is \$15,126,296 while the median is \$3,000,000 — a ratio of roughly 5:1. The standard deviation (\$40,492,650) exceeds the mean itself.

Business Impact: The average materially overstates what a typical funded startup receives. Any stakeholder using the average alone to benchmark a fundraise, or to estimate expected round size for a new founder, would be misled toward expecting a far larger round than is typical.

Recommended Action: Report the median alongside the average in every funding-size communication, and where possible stratify by stage (Section 10) before comparing round sizes, since “typical” varies enormously across Pre-Seed through Private Equity.

Insight 6: IQR outlier analysis flags exactly the same 10 deals as the top-10 list, all above \$19.1M

Finding: Using the dataset's own IQR statistics (Q1=\$1.0M, Q3=\$9.9M), the statistical upper outlier bound is just \$23,253,781 — and 10 deals exceed it, ranging from \$23.6M to \$304.5M.

Business Impact: The threshold for what counts as a “large deal” in this dataset is quite low relative to the size of the very largest rounds, meaning even a single additional Series C/D or Private Equity deal appearing in a future period could shift the statistical profile of the entire dataset.

Recommended Action: Treat any single deal above roughly \$23M as a candidate for separate disclosure or footnoting in period summaries, rather than folding it silently into an aggregate total (see Insight 3 and Section 14).

Insight 7: February's growth was driven by bigger deals, not just more of them

Finding: Startup count rose 123% from January (31) to February (69), while total funding rose 415% (from \$214.1M to \$1,101.9M) and average deal size rose from \$7.1M to \$19.3M — a 2.7× increase.

Business Impact: Because the funding increase far outpaces the deal-count increase, February's growth cannot be explained by “more startups getting funded” alone; it reflects a shift toward larger individual rounds within the month (consistent with several of the top-10 deals, including Aditya Birla Housing Finance and CleanMax, being dated in February).

Recommended Action: Before reporting month-over-month funding growth as ecosystem momentum, decompose it into a deal-count component and an average-deal-size component, and confirm the observation with at least one additional month of data given the current two-month window is too short to establish a sustained trend.

Insight 8: A 13% disclosure gap likely understates true funding concentration

Finding: 13 of 100 records (13%) have no disclosed funding amount, including 2 of the 7 Private Equity deals (NASH Industries and Mefron Technologies) and 5 of 44 Seed deals.

Business Impact: Because the missing records skew toward the highest-value stage category (Private Equity), the true total funding and true concentration figures in this period are almost certainly higher than the \$1,315,987,751 and 70.95% figures reported in Sections 7 and 15, which are floors, not ceilings.

Recommended Action: Prioritize follow-up on the two undisclosed Private Equity amounts specifically — given the average disclosed PE deal is \$141.0M, even one additional disclosed amount could materially shift the concentration figures in Insights 1 and 3.

Insight 9: 96% of startups carry multiple industry tags, which double-counts capital across industry totals

Finding: 96% of startups (96 of 100) are tagged with two or more industries, with several tagged across as many as 7 categories (e.g., AquaAirX, EyeROV, Slurrr Farm, WellWith India). Only 4 startups carry a single industry tag.

Business Impact: Because each funding round is counted once per industry tag it carries, industry-level totals in Section 11 (e.g., E-commerce's 24 startups and \$151.4M) overlap substantially with other industries' totals for the same underlying capital — industry rankings reflect thematic tag frequency, not mutually exclusive market segments, and industry totals do not sum to the dataset total.

Recommended Action: When citing “top industry” figures externally, explicitly note that they reflect overlapping tags. For a non-overlapping view, build a supplementary “primary industry only” cut using just the first listed tag per startup.

Insight 10: A single company drives nearly a quarter of all disclosed funding in this period

Finding: Aditya Birla Housing Finance's \$304,527,929 Private Equity round represents 23.1% of the entire dataset's total disclosed funding (\$1,315,987,751) on its own, and is the primary driver of both the Finance industry total (\$475.3M) and the Real Estate industry total (\$340.8M).

Business Impact: Any period-level or sector-level summary that does not call out this single deal risks implying broad-based strength in Finance or Real Estate funding that is, in fact, concentrated almost entirely in one company's raise.

Recommended Action: Always disclose the single largest deal by name and amount alongside any sector or period aggregate it materially influences — as done throughout this report — so readers can distinguish broad-based sector activity from single-deal concentration.

17. Business Recommendations

The following recommendations are drawn directly from the findings in Section 16 and are intended for anyone using this dataset or future updates to it for ecosystem monitoring, investment benchmarking, or founder research.

- Report deal count and capital volume as separate leaderboards for both funding stage and industry — conflating them (as a single “top industries” or “hottest stage” ranking) misrepresents which segments are actually most active versus most capital-intensive (Insights 1, 4).
- Track seed-to-growth conversion over subsequent reporting periods, since the current 44-startup Seed cohort represents the pipeline that later-stage capital will eventually draw from (Insight 2).
- Always disclose the single largest deal by name and amount alongside any sector- or period-level total it materially influences, most notably Aditya Birla Housing Finance's \$304.5M round (Insights 3, 10).
- Report median funding alongside average funding in every communication about typical deal size, and stratify by stage wherever possible (Insight 5).
- Flag any individual deal above roughly \$23M for separate disclosure rather than folding it silently into an aggregate, using the dataset's own IQR-derived threshold (Insight 6).
- Decompose month-over-month funding growth into a deal-count component and an average-deal-size component before characterizing it as ecosystem momentum, and extend the observation window beyond two months before drawing trend conclusions (Insight 7).
- Prioritize resolving the 13% disclosure gap, especially the two undisclosed Private Equity amounts, since missing data skews toward the highest-value stage and understates true concentration (Insight 8).
- Build a supplementary “primary industry only” view (first tag per startup) alongside the overlapping multi-tag industry breakdown, so industry totals can be read both thematically and as non-overlapping segments (Insight 9).

18. Conclusion

This analysis of 100 recently funded Indian startups shows a funding market that is broad at the entry point and extremely narrow at the top. Seed-stage activity is common (44% of deals) but commands a small share of capital (6.3%), while Private Equity is rare (7% of deals) but dominates total funding (53.6%). The 10 largest deals alone account for 70.95% of all disclosed capital, and a single company — Aditya Birla Housing Finance — represents nearly a quarter of the entire period's total on its own.

The major opportunity this analysis surfaces is in the large, currently under-capitalized Seed and Pre-Seed cohort (56 of 100 startups): tracking how many of these companies progress toward larger rounds in future periods would turn this single-period snapshot into a genuine pipeline-health indicator. The major risk is over-interpreting aggregate or industry-level totals without accounting for concentration — as demonstrated

throughout this report, nearly every headline figure in this dataset is substantially shaped by a small number of very large deals rather than broad-based activity.

Finally, the 13% disclosure gap in funding amounts — concentrated somewhat in the highest-value Private Equity stage — means every total and concentration figure in this report should be read as a conservative floor. A structured, repeatable version of this analysis, refreshed as new funding rounds are disclosed, would let stakeholders track whether concentration is increasing or easing over time, and whether the current Seed cohort is converting into future growth-stage rounds.

19. Portfolio Project Summary

Project Name

Indian Startup Funding Analysis

Tools Used

Python, Pandas, NumPy, Matplotlib, Seaborn (Jupyter Notebook)

Business Objective

Characterize how funding capital is distributed across stage, industry, and time within a cohort of 100 recently funded Indian startups — identifying where deal volume and deal value diverge, and quantifying how concentrated total funding is among the largest individual rounds.

Key Analysis

Cleaned and parsed a raw CSV of startup funding announcements (currency parsing, date parsing, multi-value industry-tag splitting); computed core funding KPIs and distribution statistics; performed IQR-based outlier detection; broke down funding by stage and by industry (accounting for multi-tag overlap); cross-tabulated top industries against funding stage; analyzed month-over-month funding and deal-count trends; and quantified funding concentration among the top 10 deals — producing 12 charts and 10 fully-grounded business insights.

Key Findings

Private Equity deals (7% of the dataset) account for 53.6% of total funding; the top 10 deals represent 70.95% of all disclosed capital; average funding (\$15.1M) is 5× the median (\$3.0M); Finance and Energy are the two highest-funded industries despite not being the most frequently tagged; and a single \$304.5M Private Equity round (Aditya Birla Housing Finance) accounts for 23.1% of the entire period's total disclosed funding.

Business Value

This analysis gives ecosystem analysts, investors, and founders a way to interpret aggregate funding headlines correctly — separating deal-count activity from capital concentration, flagging single-deal distortions before they are mistaken for broad sector trends, and surfacing the disclosure gaps that mean even these figures likely understate true market activity.

20. Skills Demonstrated

- Python (Pandas, NumPy)
- Data Cleaning & Wrangling
- Currency & Date Parsing
- Missing-Data Auditing
- Exploratory Data Analysis (EDA)
- Descriptive Statistics
- IQR Outlier Detection
- Distribution & Skew Analysis
- Multi-value Field Handling (explode/split)
- GroupBy Aggregation
- Cross-Tabulation
- Data Visualization (Matplotlib, Seaborn)
- Time-Series Trend Analysis
- Business Insight Generation
- Data Storytelling
- Portfolio Report Writing
